

## Another Jamison Success Story

### A Theater in Minnesota New Construction Project

## Project Overview

The construction of a new \$125 million theater building was recently completed in a city in Minnesota. The new facility houses three theaters: (1) the theater's signature stage that seats 1,100, (2) a 700-seat proscenium stage, and (3) a black-box studio with flexible seating. The outside of the building's walls are covered in large panels which display a large mural of photographs from past plays visible clearly at night.

The theater engages exceptional theater artists in the exploration of a variety of performances, as well as educational classes and workshops.

McGough Construction was the installing contractor for the two Jamison Sound Reduction and Specialty Doors chosen for the design.

## Stats and Scope

**JAMISON DOOR™** · (1) STC 53 Single Slide Powertron

· (1) STC 59 Double Swing Manual

## Top Favorite Project Features

Andy Rowe, Jamison Door Company Sound & Specialty Sales Representative, shares his top project features:

1. This application involved very custom Jamison Door products.
2. The STC 59 was designed to fit in a space that had limited clearance. There was only 2" between the doorway opening and ceiling, but we were up for the challenge!

“ Isolating venues like these from external noise and creating a controlled sound environment is critical to their success – financial and otherwise. I am glad we could be a part of their journey!
